Product short description:

Airmar 44-201-1-01 Long Stem B122 235khz Thru-Hull Smart Sensor For NMEA 2000 instruments

The long-stem B122 transducer is designed for use in thick-hulled wooden boats or vessels with a steep deadrise. The included High-Performance Fairing vertically orients the sound beam for strong return echoes resulting in optimal performance. The Smart digital signal processing inside the housing sends depth and temperature data to a chart plotter radar screen or digital display eliminating the need for a dedicated depth sounder. And being retractable the insert can be removed for servicing and storage.
