Product short description:

Garmin 010-11868-22 Airmar SS60 50/200kHz Thru-Hull Transducer with Garmin 8 Pin Connector

20° Tilted version for 16°-24° deadrise

The SS60 is a 600 W 50/200 kHz transducer which integrates Airmar’s popular tilted element feature. Tilted element transducers have the ceramic element fixed at either a 20° 12° or 0° angle within the transducer housing. The transducer is installed almost flush to the hull and the tilted element corrects for the hull deadrise by orienting the beam directly down. This assures maximum echo returns to the transducer and more accurate depth readings.
